1. They may be used for therapeutic delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an analogenesis or a related disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for the enhancing endothelial or tumour cells or the cells expressing NP-1, for the transport of the cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence with a tumour or ungiogenesis-related disease. The current sequence multimers, polymers or analogues of, may be used to target endothelial cells, or cells that express markers in common with endothelial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ternary ligand complex; highly functionalised phosphine ligand; disease site; cardiovascular disorder; thromboembolic disease; atherosclerosis; infectious disease; cancer; radiopharmaceutical.

Gaps

The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a patient, enabling the visualisation of platelet deposition and disease sites, and allowing the diagnosis of infection, inflammation, transplant rejection, cardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention

Sequence 5 AA;

```
The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10664).

Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide. L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker, bioactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 5, N 2 S or NN 3) comprising oxa-PnAO complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoptotein) or cells that express NP-1 with avidity of at least that of TKPPR. Also included are an ultrasound

Admilo53 is a peptide used for targetting agents to leukocytes. This peptide can be coupled to a metal radionuclide chelator (structural formal agiven in the specification), labelled with a diagnostically closeful metal isotope, to form a peptide derived radionuclide chelator. When the chelator is coupled to a targeting molecule and labelled with a diagnostically useful metal, it can be used to detect pathological conditions by diagnostic imaging. For example, AAW1053 targets the conditions by diagnostic imaging. For example, AAW1053 targets the conditions by diagnostic imaging. For example, AAW1053 targets the conditions by diagnostic imaging. For example, AAW1053 targets the conditions of a targeting agent is an alternative to the direct labelling of targeting agent is an alternative to the direct labelling of targeting agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low- affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-1gG, 1111n WEC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                ö
or antibodies. The labelled targetting molecules may be used for in-vivo diagnosis and therapy. The chelating compound is a hydratino-containing, N-hererocycle-containing compound, and the conjugated product is exemplified by S-Acm-mercaptoacetyl-Ser-N- methyl-hydratino-nicotinic acid-Gly-Thr-Lys-Pro-Arg. The peptide portion of this molecule (the present sequence) represents the tuftsin antagonist TRPR condensed via Gly onto the chelating moiety, giving a molecule which will chelate a radionuclide such as 99mTc and target it towards leukocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Leukocyte; target; direct; chelator; radionuclide; radiolabel; isotope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.

AAW31110-W31147 are peptides used for targeting a new hydrazino-type compound to various sites of disease, e.g. atherosclerotic plaque, sites of infection, platelets, thrombus or amyloid plaque. The new compound is a radiomoclide chelator and is used to radiolabel the targeting peptides for the detection and diagnostic imaging of sites of disease, e.g. amyloid plaques in Alzheimer's disease. (Updated on 25-MAR-2003 to correct PF field.)

The new compound is a radionuclide chelator and is used to radiolabel targeting peptides for the detection and disquostic imaging of sites of discase, e.g. amyloid plaques in Alzheimer's disease, thrombi in thrombosis or other sites of infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes polypeptide compounds of formula (1), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(X1-X2-X4-X5) (1), where X1-X5 = amino acids, In = a linking group; Ch = a metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, thilammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The present sequence represents a specifically claimed tuftsin receptor antagonist chelate conjugate from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oregon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "residue optionally modified by one of the following; OH, (No2)Obzl, (NO2), (Pmc)OtBu, (pmc)-Wang-resin"

The invention relates to a composition for use in targeting endothelial cells, tumour calls, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ulrasound contrast agents, for staging a tumour in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or for treating an individual exhibiting effects of an angiogenesis or a related disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for chancing endothelial or tumour cells, or other cells expressing NP-1, for therapy targeting angiogenic cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence therapy.
                                                                                                                                                                                                                                                             Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ternary ligand complex; highly functionalised phosphine ligand; disease site; cardiovascular disorder; thromboembolic disease; atherosclerosis; infectious disease; cancer; radiopharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .,

                                                                                                                                                                                                                                                                                                        The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a patient, enabling the visualisation of platelet deposition and disease sites, and allowing the disgnosis of infection, inflammation, transplant rejection, cardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention
                                                                                                                                                                                                                      New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ternary ligand complex; highly functionalised phosphine ligand; disease site; cardiovascular disorder; thromboembolic disease; atherosclerosis; infectious disease; cancer; radiopharmaceutical.

                                                                                                                                                             The present invention relates to novel highly functionalised phosphine ligands which can be used as ancillary ligands in radiopharmaceuticals. These radiopharmaceuticals can then be used to radioimage a patient, enabling the visualisation of platelet deposition and disease sites, and allowing the diagnosis of infection, inflammation, transplant rejection, eardiovascular diseases such as thromboembolic disorders, and cancer. The present sequence is a peptide which formed part of a ligand in the exemplification of the invention
                                                                             New ancillary ligands are useful as ligands for radiopharmaceuticals, which are useful for e.g. radioimaging a patient, diagnosing thromboembolic disorders, atherosclerosis, infections and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phagocytosis, tuftsin, endothelial cell, inflammation, cytostatic; antiangiogenic, NP-1, ultrasound contrast agent; tumour; angiogenesis; visualisation therapy; radiotherapy.

The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

Composition (A1) comprises a compound of formula A-LB 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, darivatisable bead attached to a fluorescent or radioactive marker, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S or N S 3) comprising or az-PnAO complexed with 99m ro. The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a substribute a suspension of gas filled microballons comprising the TKPPR compound, on ultrasound contrast agent (C1) comprising a suspension of gas filled microballons comprising the monomer, multimer or polymer of TKPPR or tits analogue with a linker to obtain a compound of formula A-L, forming a covalent or non-covalent to bond between A-L and the substrate B l or forming a covalent bond between CC the monomer, and a kit for preparing a radiopharmaceutical comprising the compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting anglogenesis or ultrasound immaging, staging a tumour, screening at least one targeted ultrasound contrast agent for the abbility to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cells withen agent and for delivery in vivo of a bloactive agent and for delivery or therapeutic cells withen a sales useful for visualisation therapy or analoms of a contrast agent for visualisation therapy or analoms of the composition is also useful for visualisation therapy or analoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phagocytosis; tuftsin; endothelial cell; inflammation; cytostatic; antiangiogenic; NP-1; ultrasound contrast agent; tumour; angiogenesis; visualisation therapy; radiotherapy.
                                                                                                                                                    Composition used in targeting endothelial cells e.g. tumor cells comprises compounds containing monomers, multimers or polymers of arginine-L-threonyl-L-lysyl-L-prolyl-L-prolyl-L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 29; DB 7; I

deriversable bead attached to a libratescent or radiocutive mainter, bloactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S 2 or NS 3 > Comprising oxa-PhAO complexed with 99m To. The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a validity of a least that of TRPPR. Also included are an ultrasound contrast agent (cl) comprising a suspension of gas filled microbubbles comprising the TRPPR compound contrast agent (cl) comprising a suspension of gas filled microbubbles comprising the TRPPR compound, an ultrasound contrast agent (cl) comprising a suspension of gas filled microbubbles comprising the TRPPR compound (which comprising the TRPPR compound contain a compound of formula A-L, forming a covalent bond between to compound of formula A-L, forming a covalent bond between to both an a conjugate B-L followed by conjugation with bond between A-L and the substrate B 1 or forming a covalent bond between B 1 and the linker to form a conjugate B-L followed by conjugation with the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting angiogenesis, for ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cells confortable cells which express NP-1, for the therapeutic cells confortable cells the composition is also useful for visualisation therapy or contrast agent cells or other cells which express NP-1 confortherapy or cells conforthelial cells, tumour cells or other c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684). Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition used in targeting endothelial cells e.g. tumor cells comprises compounds containing monomers, multimers or polymers of Larginine-L-threonyl-L-lysyl-L-prolyl-L-prolyl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ramalingam K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: Ch-Ln-(X1-X2-X4-X5)d (I), where X1-X5 = mino acids; Ln = a linking group; Ch = a metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells which accumulate at the site of infection and inflammation and can then be detected using radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The present sequence represents a specifically claimed tuftsin receptor antagonist chelate conjugate from the present invention New polypeptides and radiopharmacueticals used for imaging infection, inflammation and cancer. Tuftsin receptor antagonist, chelate conjugate, radiopharmaceutical; diagnosis; infection; inflammation; imaging; cancer; tumour. /note= "modified phenylalanine: ((6-((1-aza-2- (2-sulphophenyl)vinyl)amino)-3-pyridyl) carbonyl)-L-Query Match

The activity of compositions of the invention may be described as cytostatic. Componings of the invention may be described as cytostatic. Componings of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or for treating an individual exhibiting effects of an angiogenesis or celated disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for enhancing endothelial or tumour cells or other cells expressing NP-1, for charapy targeting angiogeneic cells, and for treating a human or animal with a tumour or angiogenesis related disease. The current sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of cells, tumour cells invention may be described as cytostatic. Componids of the invention may be described as cytostatic. Componids of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal, for screening for the ability of an agent at unmour in a human or animal, for screening for the ability of an agent or target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeuric delivery in vivo of a bicactive agent or for treating an individual exhibiting effects of an angiogenesis or a related disorder. They may be used for delivering desired muclelc acids concluded in the delivering endothelial cells, tumour cells or other cells expressing NP-1, for endothelial cells, tumour cells or other cells expressing NP-1, for characting endothelial or tumour cells or other cells expressing number of the represents a tuffetsin receptor antagonist (TKPPR) derivative of the represents a tuffetsin receptor antagonist (TKPPR) (ERU-305 and BRU-306)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker molety (of formula A-L-B 1, where A is the TKPPR peptide, L is a linker molety (of formula A-L-B 1, where A is the TKPPR peptide, L is a linker molety (of formula A-L-B 1, where A is the TKPPR peptide, L is a linker molety (of formula A-L-B 1, where A is the specification) and B is a substrate (or a phospholipid group in the compound a placetive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 S, N 2 S or N 3 ) comprising or N-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with contrast agent (c1) comprising a suspension of gas filled microbables comprising a suspension of the TKPPR compound (which comprising the TKPPR compound, preparation of the TKPPR compound (which comprising the TKPPR compound, which comprising the TKPPR compound (which comprising the TKPPR compound, preparation of the TKPPR compound (which comprising the TKPPR compound, compound, a compound, a compound of formula A-L, forming a covalent to non-covalent to obtain a compound the linker to form a conjugate B-L followed by conjugation with

    .7
/note= "The molecule is cyclised via this disulfide bond"

                                                                                                                                                                                                                                         Phagocytosis, tuftsin, endothelial cell, inflammation, cytostatic, antiangiogenic; NP-1, ultrasound contrast agent, tumour; angiogenesis, visualisation therapy, radiotherapy, cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition used in targeting endothelial cells e.g. tumor cells comprises compounds containing monomers, multimers or polymers of Larginine-L-threonyl-L-lysyl-L-prolyl-L-prolyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Von Wronski MA, Marinelli ER, Nunn AD, Pillai R,

the monomer), and a kit for preparing a radiopharmaceutical comprising the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1 for inhibiting angiogenesis, for ultrasound imaging, staging a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bioactive agent and for delivering desired mucleic acids to endothelial cells, tumour cells or other cells which express NP-1. The composition is also useful for visualisation therapy or radiotherapy of endothelial cells. The present sequence is a cyclic TKPPR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phagocytosis, tuftsin, endothelial cell, inflammation, cytostatic; antiangiogenic; NP-1, ultrasound contrast agent, tumour; angiogenesis; visualisation therapy, radiotherapy.

The invention relates to a composition (A1) comprising compounds

Containing monomers, multimers or polymers of TKPPR (ADD10684).

Composition (A1) comprises a compound of formula A-LB 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the derivatisable bead attached to a fluorescent or radioactive marker, delivery vehicle for genetic material drug or.

Composition (A1) complexed with 99m To. The compound the compound of position of pass and the compound of position of the respect transmembrane glycoprotein) or cells that express NP-1 with a variety of TKPPR. Also included are an ultrasound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a validity of at least that of TKPPR. Also included are an ultrasound cortrast agent (C1) comprising a suspension of gas filled microbubbles compusing the TKPPR compound, an ultrasound contrast agent (C2) comprising a suspension of gas filled microbubles comprising a suspension of gas filled microbubles comprising to suspension of gas filled microbubles comprising to suspension of gas filled microbubles comprising to suspension of formula A-L, forming a covalent bond between A-L and the substrate B 1 or forming a covalent bond between A-L and the substrate B 1 or forming a covalent bond between A-L and the substrate B 1 or forming a covalent bond between CC bond between A-L and the substrate B 1 or forming a covalent bond between CC ultrasound inaging staging a tumour, screening at endothelial cells, tumour cells or other cells which express NP-1, for inhibiting angiogenesis, or ultrasound inaging staging a tumour, screening at endothelial cells, tumour cells or other cells which express NP-1, for the therapoutic caids to endothelial cells, tumour cells or other cells which express NP-1, for the therapoutic caids to endothelial cells, tumour cells or other cells which express NP-1, for the therapout contrast agent for the composition is also useful for visualisati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      //note= "the side-chain (epsilon) amino group of Lys at position 7 forms a peptide bond with the C-terminus of the tetrapeptial N', '-dimethylglycyl-Ser-Cys(Acm) -Gly-; this sidechain group consists of a tripeptide metal chelator and a linking residue (Gly)"

The chelator serves as a labelling site for radionuclide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio

AAWII054-WII059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, 64Cu, 97Ru, 105Rh, 109Pd, 186Re, 188Re, 198Au, 199Au, 201Pb, 212Pb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                 Peptides AAR76218-9 are examples of peptide-ligands used in a method to produce a metal-labelled imaging agent. The method comprises attaching a ligand-target molecule e.g. a peptide to a solid surface via a linking group e.g. maleimide. The ligand can incorporate a metal atom e.g technetium, which cleaves the linker-ligand bond thus releasing a labelled peptide. The labelled peptide can then be used for imaging in tissues, cell types or organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Leukocyte; target; direct; chelator; radionuclide; radiolabel; isotope;
    Compsns. for generating metal labelled imaging agents - comprising a solid support, a linking gp. and a ligand cleavable from the linking gp. by a metal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Leukocyte-targetted peptide derived radionuclide chelator.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes polypeptide compounds of formula (I), capable of direct transformation into a radiopharmaceutical: {\rm Ch}-in-(X1-X2-X3-X5)4 (I), where X1-X5 = amino acide; in = a linking group; {\rm Ch} = a metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuftsin receptor on the surface of white cells bind in vivo to the site of infection and inflammation and can then be detected using radiation detecting probes or by imaging using a planar or ring gamma
and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-1gG, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "modification on the COOH side group: -Acp-Thr-Lys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 radiation detecting probes or by imaging using a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer.

The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting anglogenesis, for imaging and targeting an anglogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therspettic delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or a

Preferably Xaa is Gly or Ser; X is Gly-OH or Gly-TM, and TM is a cell receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /label= OTHER
/note= "residue of 2-quinolinic acid, 1- or 3-
isoquinolinic acid, pyrrole-2-carboxylic acid or indole-2
-carboxylic acid"
related disorder. They may be used for delivering desired nucleic acids to endothelial cells, tumour cells or other cells expressing NP-1, for enhancing endothelial or tumour cell-targeted gene therapy, or gene therapy targeting angiogenic cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence represents a tuftsin receptor antagonist (TKPPR) derivative tetramer BRU-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New peptide analogue metal chelator(s) - used for chelating radioactive metals for in-vivo diagnostic imaging or for therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

binding peptide. The molecule can be used to chelate a diagnostically or therapeutically useful metal such as 99m-Tc, and the targetting moiety can be used to direct the molecule to a site of interest within the body for in-vivo diagnostic imaging or for therapy. The present sequence represents specifically claimed examples of the new peptides, in which the targetting peptide is a tuftsin antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide analogue metal chelator(s) - used for chelating radioactive metals for in-vivo diagnostic imaging or for therapy.
                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                      chelate; chelating; chelator; diagnostic; imaging; therapy; tuftsin.

                                                                                                                                                                                                                            88888888888
                                                                                                                                                                            쉽
```

chel-xaa-Cys-X, in which: Chel is a chelating moiety which is the residue acid, detectocyclic amino acid analogue such as picolinic acid, dipicolinic acid, 2-carboxypyramidine, 2-carboxypyrimidine, 2-carboxypyrimidine,

The patent discloses new metal-chelating peptide analogues of formula

```
New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a specifically claimed peptide - chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radiomucilde metals such as technetium-99m. The tuftein antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin terrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an
 for in-vivo diagnostic imaging or for therapy. The present sequence represents a specifically claimed example of the new peptides, in which the targetting peptide is a tuftsin antagonist
                                                                                                              Gaps
                                                                                                               ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             note= "picolinic acid or N', N-dimethylglycine"

The chelator serves as a labelling site for radionuclide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide-chelator conjugate and complex with traceable metal - used t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "the side-chain (epsilon) amino group of Lys at position 8 forms a peptide bond with the C-terminus of the tetrapeptide N',N-dimethylglycyl-Ser-Cys(Acm)-Gly-; this sidechain group consists of a tripeptide metal chelator and a linking residue (Gly)".

AAW11054-W11059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKEPR sequence. When the chelators are coupled to a targetting molecule and labelled with a diagnostically useful coupled to a targetting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging of sites of local inflammation. Radionuclides used include 99mTc, 64Cu, 67Cu, 97Ru, 105Rh, 109Pd, 186Re, 188Re, 198Au, 199Au, 2019b, 212Pb and 212Bi. The coupling of a targeting agent and radionuclides using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-IgG, 1111n-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.

                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides AAR76218-9 are examples of peptide-ligands used in a method to produce a metal-labelled imaging agent. The method comprises attaching a ligand-target molecule e.g. a peptide to a solid surface via a linking group e.g. maleimide. The ligand can incorporate a metal atom e.g technetium, which cleaves the linker-ligand bond thus releasing a labelled peptide. The labelled peptide can then be used for imaging in tissues, cell types or organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compsns. for generating metal labelled imaging agents - comprising a solid support, a linking gp. and a ligand cleavable from the linking gp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAWI1054-WI1059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc, 67cu, 97Ru, 105Rh, 109Gd, 186Re, 188Re, 198Au, 195Au, 203Fb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99mTc-19G, 111In-WBC and 99mTc-Nanocoll. They image more rapidly than the known agents and show superior biodistribution

AAWII054-WI1059 are peptide derived radionuclide chelators that are targetted to leukocytes, via the GTKZPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99MTC 64Cu, 67Cu, 97Ru, 105Rh, 109Gh, 186Re, 188Re, 198Au, 199Au, 203Db, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 99MTC-19G, 111In-WBC and 99MTC-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             target; direct; chelator; radionuclide; radiolabel; isotope;

low-affinity sites, forming unstable complexes. The new conjugates give better scintigraphic images in rat inflammation studies than known imaging agents Ga-67, 199TC-1GG, 1111n-KBC and 99mC-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                                                                                                                                                                                                    AAWI1054-WI1059 are peptide derived radionuclide chelators that are targetted to lakkocytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukocyte-targetted chelators are useful for the rapid imaging of sites of local inflammation. Radionuclides used include 99mTc 64Cu, 67Cu, 97Ru, 105Rh, 109Pd, 186Re, 188Re, 198Au, 199Au, 203Pb, 212Pb and 212Bir The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Leukocyte; target; direct; chelator; radionuclide; radiolabel; isotope; diagnostic imaging.
                                                                                                                                                             New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

AAWI1054-WI1059 are peptide derived radionuclide chelators that are targetted to leukccytes, via the GTKPPR sequence. When the chelators are coupled to a targeting molecule and labelled with a diagnostically useful metal, they can be used to detect pathological conditions by diagnostic imaging. The leukccyte-targetted chelators are useful for the rapid flanging of sites of local inflammation. Radionuclides used include 99MTC 64th, 67Ch, 97Ru, 105Rh, 109Gh, 186Re, 188Re, 198Au, 199Au, 201Pb, 212Pb and 212Bi. The coupling of a targeting agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low-affinity sites, forming unstable complexes. The new conjugates give better scinigraphic images in rat inflammation studies than known imaging agents Ga-67, 99MTC-19G, 111In-WBC and 99MTC-Nanocoll. They image more rapidly than the known agents and show superior biodistribution
                                                     New peptide derived radionuclide chelators and metal complexes - useful for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /label= ligand derivatised residue

The specification describes chirally pure peptides which are used for preparation of metal complexes. When converted to complexes with (radioactive) metals or their oxides or nitrides, the peptides are useful for diagnostic (radio) imaging (by labeling biomolecules). The present peptide is used in the course of the invention
                                                  Chirally pure peptides for preparation of metal complexes, used for diagnostic imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide-chelator conjugate; metal chelator; diagnostic imaging; inflammation; radionuclide; tuftsin; analogue; antagonist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides comprises (1) an imaging agent (a chelator for a traceable metal)

which localises selectively at an in-vivo site of diagnostic interest;

(2) a ligand which localises at a point (in vivo) removed from the site of diagnostic interest; and (3) a metal-cleavable bond coupling the chelator of the imaging agent to the ligand, this bond being cleaved upon compact of the metal and chelator. Preferably the chelator is the sequence N.N-dimethyl- Gly-Ser-Cys; the ligand is a parcosyl residue; the traceable metal is 99m-TC; and a targetting complexoryl residue; the traceable metal is 99m-TC; and a targetting complexoryl residue; the traceable metal is 99m-TC; and a targetting complexoryl residue; the traceable metal is 99m-TC; and a targetting complexoryl residue; the traceable metal is 99m-TC; and a targetting complexoryl residue; the traceable metal is 99m-TC; and a targetting con any unlabelled imaging agent are sequestered to the removed site. By sequestering unlabeled imaging agent, the labeled imaging agent does not compete to occupy the site of interest, resulting in images of enhanced resolution. The present sequence is the preferred molecule used for imaging; in which a galactosyl residue is attached to the thiol group compact of meavable maleimido coupling group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                    New cpd. for use in diagnostic imaging - consists of imaging agent, which is chelator for traceable metal, coupled by metal-cleavable bond to ligand which localises at different site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chirally pure peptide; metal complex; diagnostic imaging; radioimaging

New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on the gastrointestinal tract.
                                                                             The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunostimulant; immunosuppressive; tuftsin receptor binder; tuftsin receptor; tufstin receptor analogue; imaging; infection; tuffiammention; immunostimulatory; immune system disorder; analgesic; CNS condition; whole body imaging; radiotherapy; tuftsin metallopeptide analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tufstin metallopeptide analogue #48.
                                                                                                                                                                                                                                                                                                                                                                                                 ADE81165 standard; peptide; 10 AA.

The invention describes a peptide or its salt comprising a metal ion-
binding backbone including at least two contiguous amino acids for
complexing with the metal ion. The peptide is specific for the tufterin
complexing the metal ion. The peptide is specific for the tufterin
corpusor on complexing the metal ion-binding backbone with the metal ion.
The peptide is useful for imaging a site of infection or inflammation;
corpusor in immunostimulatory response in mammals; for treating immune
cystem disorders; in biological, pharmaceutical and radiopharmaceutical
applications; as an analgesic in the treatment of CNS conditions; and in
whole body imaging and radiotherapy. The peptide complexed with the metal ion the peptide
complexed with the metal ion. The relabeled Thr-D-Lys-
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
complexed with the metal ion. The relabeled Thr-D-Lys-
dly-D-Cys-Arg is the most potent existing tuftsin molecule. The peptide-
complexed with the metal contraction of existing peptides.
Cys-Arg is the most potent existing tuftsin molecule. The peptide
conformation with a metal ion. The metal ion profiles. The
peptide analogue is not conformationally restricted in the absence of a
metal ion but has high potency and concomitant conformational restriction
conformationally fixed on metal conformation. The complexation of the
conformationally fixed on metal conformation restrictions in the peptide
conformationally fixed on metal ion complexation. The complexation of the
conformationally fixed on metal conformations the profile of carance from the body, bloavailability and pharmacokinetics in
mammals. The peptide metal ion complex stimulates polymorphonuclear
conformations. Proposide metal ion complex stimulates polymorphonuclear
conformation enzymatic or peptidese degradation this is the amino acid
cycles, monocytes and macrophages cowards phagocyclosis, produce
chigher titer antibodies, and can transit the guardian produce
cycles authorities analogue of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

New peptide-chelator conjugate and complex with traceable metal - used to image sites of inflammation in vivo without significant accumulation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a specifically claimed peptide- chelator conjugate in which a tuftsin antagonist peptide is coupled to a metal chelator, via a linking group. The chelator serves as a labelling site for radionuclide metals such as technetium-99m. The tuftsin antagonist targets the conjugate to macrophages and neutrophils at sites of inflammation without significant accumulation in the gastrointestinal tract (unlike the native tuftsin tetrapeptide). The conjugate is thus useful for diagnostic imaging of inflammation sites, providing an improved target to background ratio
                                                                                                                                                                               /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a peptide or its salt comprising a metal ion-
binding backbone including at least two contiguous amino acids for
complexing with the metal ion. The peptide is specific for the tuftsin
receptor on complexing the metal ion-binding backbone with the metal ion.
The peptide is useful for imaging a site of infection or inflammation;
for causing an immunostimulatory response in mammals, for treating immune
system disorders; in biological, pharmaceutical and radiopharmaceutical
applications; as an analgesic in the treatment of CNS conditions; and in
whole body imaging and radiotherapy. The peptide complexed with the metal
ion is resistant to enzymatic degradation. The affinity of the peptide
for the tuftsin receptor is higher when the metal ion-binding backbone is
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
ion is resistant to complexed with the metal ion. Finding backbone is
complexed with the metal ion. The Tc-labeled Thr-D-Lys-
dly-D-Cys-Arg is the most potent existing tuffsin molecule. The peptide
accomplexed with the metal ion. The metal ion-binding peptide.

Gly-D-Cys-Arg is the most potent existing tuffsin molecule. The peptide
accomplexed with the metal ion. The morphlexed or existing peptide.

Grance is not conformationally restricted in the absence of a
metal ion but has high potency and concomitant conformation in the peptide
complexation with a metal ion. The metal complexation in the peptide
conformationally fixed on metal conformations in the peptide
conformationally fixed on metal ion. The metal binding site is
conformationally fixed on metal ion complexation. The complexation of the
mode of clearance from the body, bioavailability and pharmacokinetics in
mammals. The peptide metal ion complex stimulates polymorphonuclear
granulocytes, monocytes and macrophages towards phagocytosis, produces
ingranlocytes, monocytes and macrophages towards phagocytosis, produces
ingranlocytes, monocytes and macrophages towards phagocytosis, produces
ingranlocytes and metallocomplexed t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                 Tuftsin metallopeptide, useful e.g. for imaging site of infection or inflammation, comprises metal ion-binding backbone including at least two contiguous amino acids for complexing with metal ion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

(Composition (A1) comprises a compound of formula A-L-B 1, where A is the TKPPR peptide, L is a linker moiety (of formula given in the specification) and B is a substrate (or a phospholipid group, derivatisable bead attached to a fluorescent or radioactive marker, bioactive agent, delivery vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4 , S 4 , N 3 S, N 2 S or NS 3 ) comprising oxa-PhAO complexed with 99m Tc). The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with avidity of at least that of TKPPR. Also included are an ultrasound
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phagocytosis, tuftsin; endothelial cell; inflammation; cytostatic; antiangiogenic; NP-1; ultzasound contrast agent; tumour; angiogenesis; visualisation therapy; radiotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /label= OTHER

                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition (A1) comprising compounds containing monomers, multimers or polymers of TKPPR (ADD10684).

C Composition (A1) comprises a compound of formula A-LB 1, where A is the TKPPR peptide, I is a linker moiety (of formula A-LB 1, where A is the TKPPR peptide, I is a linker moiety (of formula A-LB 1, where A is the TKPPR peptide, I is a linker moiety (of formula A-LB 1, where A is the TKPPR peptide, I is a substrate (or a phospholipid group, derivers vehicle for genetic material, drug or therapeutic, or chelating group (preferably N 4, S 4, N 3 5, N 2 5 2 or NS 3) comprising oza-PnAO complexed with 99m TC. The compound specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with specifically binds to NP-1 (Vascular endothelial growth factor binding receptor transmembrane glycoprotein) or cells that express NP-1 with a variation as uspension of gas filled microbubles comprising the TKPPR compound, an ultrasound contrast agent (C1) comprising a suspension of gas filled microbubles comprising the TKPPR compound (which comprising the the substrate B 1 or forming a covalent bond between A-L and the substrate B 1 or forming a covalent bond between C compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bioactive agent and for delivering desired moleic cacids to endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cacids to endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic cacids to endothelial cells, tumour cells or other c
                                                                                                                              /label= OTHER
/note= "lys is covalently linked to a further TKPPRKRPPKT
peptide whose Lys (6) is linked to Gly-TTDA (4,7,10-
Trioxal,13-TridecaneDiamine)-oregon green"

contrast agent (c1) comprising a suspension of gas filled microbubbles comprising the TKPPR compound, an ultrasound contrast agent (c2) comprising the TKPPR compound (which comprising the TKPPR compound (which comprises conjugating the TKPPR compound, preparation of the TKPPR compound (which comprises conjugating the monomer, multimer or polymer of TKPPR or its analogue with a linker to compound of formula A-L, forming a covalent or non-covalent bond between A-L and the substrate B l or forming a covalent bond between B l and the linker to form a conjugate B-L followed by conjugation with the compound. The compound used for targeting endothelial cells, tumour cells or other cells which express NP-1, for inhibiting anglogenesis, for ultrasound inmading, staging a tumour, screening at least one targeted ultrasound inmading, staging a tumour, screening at least one targeted ultrasound contrast agent for the ability to target endothelial cells, tumour cells or other cells which express NP-1, for the therapeutic delivery in vivo of a bloactive agent and for delivering desired nucleic acids to endothelial cells, tumour cells or other cells which express NP-1. The composition is also useful for visualisation therapy or part and for delivery in view of a many and the composition is also useful for visualisation therapy or part and the part and the composition of the cells. The present sequence is a TKPPR dimer and the composition of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "residue modified by the following; F-108, OCH2CONH"

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bloactive agent or related disorder. They may be used for delivering effects of an angiogenesis or a celated disorder. They may be used for delivering espreashing NP-1, for condothelial cells, tumour cells or other cells expressing NP-1, for characting endothelial or tumour cell-targeted gene therapy, or gene therapy targeting angiogenic cells, and for treating a human or animal with a tumour or anglogenesis related disease. The current sequence theraper antimal cells, and so the cells and a human or animal content at tuftsin receptor antagonist (TKDPR) derivative of the
                                                                                                                                           Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tuftsin, endothelial cell, drug delivery, gene therapy, NP-1,

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cyrostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells to other cells that express NP-1 in a human or animal, for screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-1. They may be used for therapeutic delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or created disorder. They may be used for delivery in vivo of a bioactive agent or for treating an individual exhibiting effects of an angiogenesis or a related disorder. They may be used for delivering desired nucleic acids to enhancing endothelial or tumour cells or other cells ensures the creating and the tumour cells, and for treating a human or animal with a tumour or angiogenesis-related disease. The current sequence complexed with a radioactive metal that is described in the specification as 99mTc radiopharmaceutical Composition for use in targeting endothelial cells, tumor cells or other cells which express NP-1 comprises a compound containing a polypeptide, Ramalingam K; lli ER, Nunn AD, Pillai R, Nanjappan P, Raju N; Example 37; Page 128; 146pp; English. Novel human diagnostic protein #6998.

```
The invention relates to isolated polymuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclecitides are also used and in recombinant production of (II). The polymuclecitides are also used genes. (I) is useful in gene therapy techniques to restore normal activity of (II) at useful in the polymucle or identifying expressed cativity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful for treating disorders onlypeptide and polypurclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or cher trails to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                    Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 20; SEQ ID NO 37366; 103pp; English
